
A
Fixed stationary threshold
growth rate of $\mu = -3$ at P2
proneural turnover factor α
$\lambda_N^{\xi} = 1.304815343$
for every α
$\alpha = 1$
explicit D-N-A-S
slow-S limit $d_S[G(-3) - 1]$
DNA reduction (S slaved)
DN reduction (A, S slaved)
B
Reference parameter sample
DNA reduction λ_{pattern}
explicit model λ_{pattern}
equal rates
n = 1453
median ratio 4.9
reduction faster in 100%
C
Growth validation at P2
explicit model
DNA reduction
K-mode amplitude / D^*
time t
fit 0.1031
pole 0.1031
[0, 67.25]
fit 1.5975
pole 1.5975
[0, 4.5]
D
Final pattern at P2 ($t = 400$)
explicit model
DNA reduction
Delta D
max $|D_{\text{explicit}} - D_{\text{DNA}}| = 9 \times 10^{-11}$
